Our shelter design aims for the fastest possible means of deployment: the tent and furniture are all composed of single, unfolding pieces.

Unlike typical tent structures, this tent’s fabric and poles are permanently attached to one another. The tent poles are strategically segmented with pinch locks, minimizing the number of loose parts.

A dramatic entry provides a warm welcome and marks the BTB shelter as one that is public and welcoming, yet discreet.

A sealable, covered structure provides a private environment for examinations, as well as keeping dust out of the treatment area.

Nets provide natural light and ventilation without allowing outside observation.

The entrance is a welcoming gesture, a hand extending from the clinic providing a shaded entrance and directionality. This directionality places agency in the hands of the volunteers, allowing them to decide the most appropriate orientation without sacrificing the privacy of the patients.
